

STAR LAMP ASSEMBLY INSTRUCTIONS

IMPORTANT: THIS LAMP USES A 10 WATT "COMPACT FLUORESCENT" BULB EQUIVALENT TO 40 WATTS. **DO NOT USE AN OLD-FASHIONED INCANDESCENT LIGHT BULB.** COMPACT FLUORESCENT BULBS REMAIN COOL TO THE TOUCH, USE LESS ENERGY AND LAST FOR YEARS. THEY ARE READILY AVAILABLE AT WAL-MART, HOME DEPOT AND SIMILAR STORES.

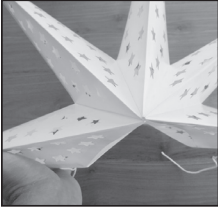

①

Begin by **carefully** inserting your fingers between each leaf of the star to separate one from another. Expand the legs of the star by placing your fingers inside, starting with the center and working outward.

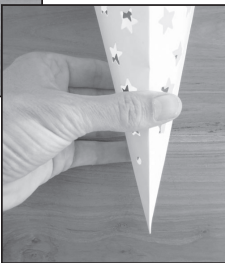

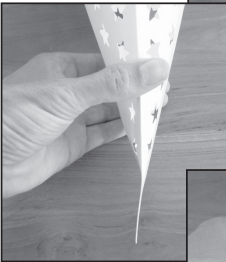

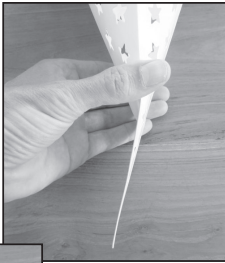

②

Next, gently fan out the leaves, carefully working apart any sticky leaves from one another.

③

Pull the star open further until the two strings can be pulled loosely together. You might have some points with a flattened bend in them. Carefully pinch the star point together to force the tip open. You may need to reach inside to unstick the tip to open it up.

④

Tie the string together. Be sure to pull the string tight enough to eliminate any gap between the two halves, as shown..

⑤

Insert the compact fluorescent bulb into the socket as shown. Compact fluorescent bulbs are energy efficient, remain cool to the touch, and save money. **Do not use an incandescent bulb with the paper star, as it may become hot and cause a fire.**

⑥

Insert the bulb and socket into the opening of the star. When the socket is completely inside the star, it should close like a clamshell around the cord. There may be a small gap remaining, but this will close when the lamp is hung.

⑦

Congratulations! Your star lamp is now ready to hang from a ceiling hook. You can use a second hook mounted at the top of the wall to make the cord trail down to the floor cleanly. We hope you enjoy your new star lamp!
